

smarti's got you covered

smarti® IP INTERCOM

- **smarti**® IP Intercom is a touch screen based smart intercom solution for residential and corporate buildings. It uses SIP protocol so in addition to intercom calls it can also act as an IP phone. This means that if you are not at home or in your office, calls from visitors can be diverted to mobile and/or stationary phones.
- You can accept incoming intercom calls on your **smarti**® indoor unit, mobile phone, laptop computer, stationary phone, IP phone etc.
- **smarti**® IP intercom supports DTMF commands. During your call you can send commands to the intercom system by dialling them into your phone/mobile phone (for opening the entry door, turning on lights etc.).
- Because the **smarti**® IP Intercom is SIP based it can also use IP phones for the indoor units. This means that it can be easily integrated into existing SIP based phone systems.
- If you choose to use **smarti**® units as your indoor units you gain additional benefits like video intercom and building/home automation.
- The **smarti**® unit on the entrance can be used as a keyless access control system using PIN codes, face recognition, voice recognition, proximity cards or any combination of the above.
- You can call the **smarti**® unit at the entrance from your indoor unit, mobile, stationary or IP phone. This way you can send commands to the unit (for example to turn on lights) or warn people at the entrance to move away from the door etc.
