#### Key Specifications / Special Features

Based on prerecorded biometric samples, the Smarti first recognizes people and then acts according to predefined instructions. It can register events with digital photos, unlock doors, turn on lights and send SMS or e-mails. Everything is recorded; events with an exact date, hour and photo are saved in the database and custom reports can be generated and printed. Video messages can also be sent the moment the addressee is recognized with messages played. Besides biometric recognition, the system offers PIN codes, which can be entered directly on touch screens. Real-time video surveillance is also possible over LAN. The main advantage of this great product is integration of multiple additional features like video messaging, intercom, surveillance and phone into one compact device at a reasonable price. Smarti is also completely protocol-independent and can, therefore, be used to control almost any kind of I/O device.
